ANALYST NOTE

Hera local LLM

The EVO_GG1RSISNIP_v1542 backtest on NVDA failed, delivering a negative ROI of -0.63% with a meager Sharpe ratio of 0.09. A win rate of 33.3% across only three trades suggests the signal logic lacks robustness in the current volatility regime. The 23.49% maximum drawdown indicates significant risk exposure that contradicts typical institutional risk parameters. With such a minimal sample size, statistical confidence is negligible, rendering the results inconclusive rather than definitively poor. The next step is to expand the lookback period and increase trade frequency to generate a statistically significant dataset for optimization.
