ANALYST NOTE

Hera local LLM

The backtest for AMZN with the EVO_EVOEVOE_v614 strategy yielded a -2.39% ROI and a negative Sharpe ratio of -0.12, indicating a loss of purchasing power over the simulated period. With only three trades executed, the 33.3% win rate and 17.43% maximum drawdown lack statistical significance, rendering the results highly unreliable for institutional decision-making. The extreme sample size prevents distinguishing between random market noise and genuine strategy inefficiency, so the observed underperformance could easily be a statistical fluke. We must immediately increase the historical lookback period or adjust parameters to generate a robust equity curve before any live deployment is considered.
