ANALYST NOTE

Hera local LLM

The EVO_GG1RSISNIP_v1025 strategy on RDN failed completely, delivering a -5.59% return and zero winning trades while suffering a 14.78% drawdown across only three executions. With such a limited sample size, these negative statistics lack statistical significance and could easily be random noise rather than a flaw in the core logic. The negative Sharpe ratio confirms that the risk-adjusted performance was poor, suggesting the entry triggers were not properly filtered against market conditions. To validate the approach, we must expand the backtest window significantly or adjust stop-loss parameters to prevent immediate liquidation on initial signals. This analysis remains educational and does not constitute investment advice.
