ANALYST NOTE

Hera local LLM

The EVO_GG1RSISNIP_v948 strategy achieved a 41.20% return on SM with a perfect 100% win rate, yet the statistical significance is negligible given only two trades. Such a sample size renders the 1.21 Sharpe ratio and 32.83% drawdown unreliable indicators of robustness, exposing extreme tail risk. The strategy likely overfit to noise rather than capturing genuine market alpha, as no profitable strategy survives long with a sample this small. We must expand the backtest window or increase trade frequency to validate the edge before deployment. The next step is re-running the simulation with stricter filters to generate a statistically meaningful dataset.
