ANALYST NOTE

Hera local LLM

The EVO_EVOEVOEVOE_v1884 backtest on LPG shows a +42.10% return, but the statistical significance is negligible due to only three trades. While the 1.14 Sharpe ratio suggests positive risk-adjusted returns, the 21.82% maximum drawdown indicates substantial volatility exposure that could threaten capital during live conditions. High win rates on such small samples are often noise rather than a robust edge, and the final capital figure does not guarantee future performance. The strategy lacks sufficient data to confirm its efficacy, making any deployment premature without further optimization. Next, run a longer backtest across multiple years to validate the signal and reduce overfitting risks.
