ANALYST NOTE

Hera local LLM

The EVO_EVOEVOEVOE_v2082 strategy on AMZN is currently non-viable, delivering a -6.61% loss with a negative Sharpe ratio of -0.47. Only three trades were executed, creating a statistically insignificant sample that fails to validate any signal logic. The 17.84% maximum drawdown indicates poor risk control during the initial equity curve, suggesting overfitting or regime mismatch. A concrete next step is to expand the backtest window to capture more market cycles and filter entries by volatility regimes. Until the strategy demonstrates robustness across a larger dataset, it must remain inactive for live deployment.
