ANALYST NOTE

Hera local LLM

The EVO_GG1RSISNIP_v407 backtest on MSFT generated a +19.01% return with a Sharpe ratio of 1.02, yet the strategy is statistically unreliable due to only two trades. A 50% win rate with such low trade frequency creates a high probability of overfitting to random noise rather than capturing genuine market inefficiencies. The 14.24% maximum drawdown suggests significant volatility exposure that the current sample size cannot adequately mitigate. We must expand the testing window and introduce walk-forward analysis to validate performance across different market regimes before deployment.
